

Mean Class Size

Suppose a college is offering five sections of an introductory statistics course. The class sizes for the sections are:

Section	301	302	303	304	305
Class size	10	4	5	3	6

- a) Find the mean class size per section. What is the observational unit? What is the variable?
- b) Now ask each of the 28 students in the course for the class size of their own section. Find the mean class size per student, using the class sizes the students report. What is the observational unit? What is the variable? [Hint: The 10 students in section 301 will all report a class size of 10.]
