

Parameter and Statistic

For each situation, identify the **population parameter** and the **sample statistic**. Give each value when it is known. If the parameter is unknown, write **unknown**.

1. Online Orders

A retailer wants to know the mean amount spent on all online orders placed last month. A sample of 380 orders had a mean of \$74.60.

2. Left-Handed Students

A college wants to know the proportion of all its students who are left-handed. In a sample of 240 students, 29 were left-handed.

3. Jacket Production

A factory made 1,200 jackets on Monday. Records for all 1,200 jackets show a mean sewing time of 41.8 minutes. A sample of 60 jackets had a mean sewing time of 43.1 minutes.

4. Mobile Payments

A store chain wants to know the proportion of all customers who pay with its mobile app. Researchers observed 800 customers, and 436 paid with the app.

5. Defective Buttons

A shipment contains 5,000 buttons. Inspectors checked every button and found that 125 were defective. They also selected a sample of 200 buttons, and 8 of those were defective.
