

Mean Class Size

Suppose a college is offering five sections of an introductory statistics course. The class sizes for the sections are:

Section	301	302	303	304	305
Class size	10	4	5	3	6

- a) Consider the 5 sections to be the observational units. What is the variable? Calculate the mean class size.
- b) Now consider the 28 students taking the course to be the observational units. Each student reports the class size of their own section. What is the variable? Calculate the mean of this variable. [Hint: The 10 students in section 301 will all report a class size of 10.]
